                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to hybrid polypeptides comprising enhancer peptide sequence linked to core polypeptides. The enhancer polypeptides are dearlyed from various retroviral envelope (9p41) protein sequences, especially from HIV-1, HIV-2 and SIV. The enhancer peptides enhance the pharmacokinetic properties such as increasing the half-life of any core polypeptide that they are linked to. The core polypeptides are any polypeptide that may be introduced into a living system and that can function as a pharmacoligically useful peptide for the treatment or prevention of a disease. The core polypeptides are bloactive peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                           Retrovirus; hybrid polypeptide; enhancer; 9p41; envelope protein; HIV-1; HIV-2; SIV; pharmacokinetic; half-11fe; growth factor; cytokine; viral; anti-fusogenic; differentiation factor; interleukin; interferon; colony stimulating factor; hormone; angiogenic factor.
                                                                                                                                                                                                                                             Gaps
                                                     non-conserved region 1, of the outer membrane protein CopB (see AAW46271) of Moraxella catarrhalis strain 035E. Claimed isolated peptides of about 5-60 anino acid residues comprise at least this 8-amino acid residues comprise at least conscional antibody 10F3. The 8-amino peptide is most preferred for binding to 10F3. It includes the ABT-295 residue of CopB that is required for 10F3 binding. Claimed peptides (see AAW46274-84) from non-conserved region 1 can be used in the diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new hybrid polypeptide with enhanced pharmacokinetic properties comprises enhancer sequence -

The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as R8V and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in
selected from a growth factor, cytokine, differentiation factor, interleukin, interferon, colony stimulating factor, hormone or anglogenic factor. The peptides of the invention can be used for inhibiting viral infection and can be used in anti-viral and anti-fusogenic treatments. Sequences AAY88651-Y90055 represent core polypeptide fragments that can be used in the invention. Some sequences among those indicated also comprise enhancer fragments at terminal ends and form hybrid polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV; virucide; heptad repeat region; transmembrane protein; gp41; HR1; HR2; infection.

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention corresponds to amino acids 588-595 of gp41 from HIV-1LAI. The invention of correction of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antilusogenic, antifusogenic, artivital or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The presents sequence represents one of the DP178-like/DP107-like peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a compound that inhibits the formation of or disrupts a DPIO/7/DPI78 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DPI07/DPI78 complex
                                                                                                                                                                                                                                  Anti-retroviral; DP178-like; DP107-like; transmembrane protein gp41; antifusogenic; antiviral; HIV transmission; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated analogues of the heptad repeat region peptides pp178 and DP107. DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid polypeptide exhibits enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide when core polypeptides can be used for modulating fusogenic events and intracellular processes involving coiled-coil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotransmitter exchange and sperm-egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections that involve cell-cell and/or virus, elegatics wirus, mason-pfizer virus and polio virus).

The enhancer peptide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the incidence and severity of adverse side effects.

In which that we are not assertivity of the diagnostic procedure is the character of the sensitivity of the diagnostic procedure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sequence 9, Application US/09258754

Patent No. 6174687

GENERAL INFORMATION:

APPLICANT: Ruoslahti, Erki

APPLICANT: Rajotte, Daniel

TITLE OF INVENTION: Membrane Dipeptidase

TITLE OF INVENTION: Membrane Dipeptidase

TITLE OF INVENTION: NUMBER: US/09/258,754

CURRENT FILING DATE: 1999-02-26

EARLIER APPLICATION NUMBER: 09/042,107

EARLIER PILING DATE: 1999-03-13

NUMBER OF SEQ ID NOS: 452

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 9

LENGTH: 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9, Application US/09042107

Beatent No. 623287

Sequence 9, Application US/08232261
Patent No. 5498601
GENERAL INFORMATION:
APPLICANT: Sato, Yoshim
APPLICANT: Katada, Jun
TITLE OF INVENTION: Aggregation-Inhibiting Agents, Blood
TITLE OF INVENTION: Coagulation-Inhibiting Agents, Blood
TITLE OF INVENTION: Circulation, Cell Adhesion-Inhibiting Agents, Tumor
TITLE OF INVENTION: Aggregation-Inhibiting Agents, Tumor
TITLE OF INVENTION: Aggregation-Inhibiting Agents, Tumor

T-cell receptor beta chain V-D-J region (135-1G) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C; Accession: Pr0722
B; Feeney, A.J.
J. Exp. Med. 174, 115-124, 1991
A; Title: Junctional sequences of fetal T cell receptor beta chains have few N regions.
A; Recence number: Pr0509; MUID:91277601
A; Accession: Pr0722
A; Status: translation not shown
A; Molecule type: DNA
A; Residues: 1-7 < FEE>
A; Experimental source: newborn thymus, strain BALB/C
C; Keywords: T-cell receptor
                                                                                                                                                                                                                             Cell receptor beta chain V-D-J region (111-1H) - mouse (fragment)
C; Species: Mus musculus (house mouse)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δy
                                                                                                                                                                                          The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron emission temporaphy. Radiolabeling thiol-containing peptides with canisation temporaphy. Radiolabeling thiol-containing peptides with canisation temporaphy. Radiolabeling thiol-containing a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIR2-(CH2)n-X, or a fluorinated alkene in which at least one of the two double bonded carbon abears at least one leaving group comprising 1. Br. Cl. azide, tosylate, mesylate, nosylate, n. m = 0-2; n.m = 0-2; x = 1, Br. Cl. azide, tosylate, mesylate, nosylate, triflate, maleimide of principally substituted by 1-2 alkyl) or 3-sulfomaleimide; Rl. R2 = I, Br. Cl. azide, terriary amine, quaternary ammonium, alkyl. Br. Cl. azide, terriary amine, quaternary ammonium, alkyl. OOK, COOK, OOK, OK) of sulfonic acid, terliary amine or quaternary ammonium, cook, terriary amine, quaternary ammonium, alkyl. COOK, cook; of coptionally substituted by CONH2, COOH, OH, sulfonic acid, terliary amine or quaternary ammonium, cook, sulfonic acid, terriary amine or quaternary ammonium, alkyl. COOK, cook; on the containing vectors such as proteins, antibodies, antibody fragments and receptor-targeted peptides for Radiolabeling peptide-containing receptor-targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0314-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprisable administering a bi-specific cartibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targetling methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18F radionuclide; targeting vector; positron emission tomography; F-18; radiolabeling; thiol; fluorine-18.

Radiolabeling thiol-containing peptides with fluorine-18

Claim 15; Page 15; 22pp; English.

```
into peptide containing targeting vectors for use in clinical positron emission tomography. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F (CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRIRZ-(CH2)m-CRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       targeting vectors such as proteins, antibodies, antibody fragments and receptor- targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0314-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for incorporating 18F radionuclide

The invention relates to the use of certain heptapeptide somatostatin derivatives and/or phenylhydrazone derivatives for the preparation of medicaments possessing neurogenic and/or non-neurogenic antinflammatory and/or analgesic effects. The derivatives are used for treating pain and for treating neurogenic inflammation in the pathomechanism of rhinitis, bronchitis, bronchial asthma, arthritis, allergic conjunctivitis, urticaria, colitis and psoriasis. The present sequence is a preferred example of a heptapeptide somatostatin derivative for use in the invention.
                                                                                                                                                 Somatostatin derivative VZ-1038 for antiinflammatory or analgesic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of somatostatin derivatives and phenylhydrazone derivatives for preparation of medicaments with neurogenic and/or non-neurogenic antiinflammatory and/or analgesic effects -
                                                                                                                                                                            Somatostatin, antiinflammatory; analgesic; rhinitis; bronchitis; bronchial asthma; arthritis; allergic conjunctivitis; urticaria; colitis; psoriasis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the use of certain heptapeptide somatostatin derivatives and/or phenylhydrazone derivatives for the preparation of medicaments possessing neurogenic and/or non-neurogenic antiinflammatory and/or analgesic effects. The derivatives are used for treating pain and for treating neurogenic inflammation in the pathomechanism of rhinitis, bronchitis, bronchial asthma, arthritis, allergic conjunctivitis, urticaria, colitis and psoriasis. The present sequence is a preferred example of a heptapeptide somatostatin derivative for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Helyes 2, Erchegyi J, Horvath A;
                                                                                                                                                                                                                                           Somatostatin derivative VZ-934 for antiinflammatory or analgesic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a method of treating a bi-specific diseased tissues in a patient comprising administering a bi-specific attibudy (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds targeted conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                       Immunogenic peptide; bi-specific antibody; diagnosis; immune response; diseased tissue identification; therapy.

while still bonded to the solid phase. The products of the invention have cytostatic activity and are tyrosine kinase inhibitors. (I) inhibits and the tyrosine kinase activity of various human stoomach cancer cell lines and thus inhibits cellular proliferation. The heptapeptide (I) described in the invention is a somatostatin analog which shows strong antitumor eativity in vitro and in vivo. The SP synthesis method gives (I) is more which the cyclization is carried out after cleaving the peptide from the which the cyclization method is also a simple synthesis of (I) in high yield; typically the tert-butyl-protected precursor can be oxidized in a yield of 70-80%. Ax51896-x51900 represent peptides used in the synthesis of biostatin T7232 described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tumour; cancer; neoplasm; malignancy; psoriasis; regulation of; release of; growth hormone; insulin; glucagon; prolactin; inhibit exopeptidase; inhibit tumour growth; tumour transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           , Bokonyi G, Csuka O, Horvath A, Horvath J, Idei M;

These peptides are used in the invention to inhibit the accelerated growth of tumours. The growth is induced surgically and the tumour is of epithelial origin, eg. lung or colon tumours or partic. prostate or breast tumours, or melanoma. The peptides are known inhibitors of cancer cell growth and are partic. applied to the site of trauma, topically or subcutaneously.
                                                                                                                                                                 Gaps
         and selective pharmacological action than somatostatin. It has a structure inhibiting the activity of exopeptidases. It can be used in medicaments to inhibit tumour growth or the activity of tyrosine kinase enzymes involved in tumour growth ransformation. It is also useful
                                                   for regulating the release of growth hormone, insulin, glucagon and prolactin. It may also be used to inhibit pathological processes such as psoriasis, elicited by the pathological proliferation of
                                                                                                                                                                                                                                                                                                                                Somatostatin analog 41 - acts as agonist to inhibit tumour growth.
This peptide is a somatostatin analogue showing more advantageous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting accelerating tumour growth after trauma, esp surgery by treatment with somatostatin or its agonists, esp applied to the site of trauma

This peptide is a somatostatin analogue which has activity in inhibiting the release of growth hormone. It can be used for the treatment of diseases characterised by an imbalance of growth hormone. In particular, it can be used for the treatment of endocrine tumours and acromegaly. The peptide can also be used as a diagnostic agent for tumours. It is particularly active compared with known somatostatin analogues (eg. Antarelix or Lanreotide) or somatostatin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a somatostatin agonist, that can be used in the method of the invention. The method is for the inhibition of fibrosis by the administration of somatostatin or particularly its agonists. The method is specifically used against fibrosis in the kidney, lung, liver or skin (particularly where caused by chemotherapy but also the result of glomerulonephritis, diabetes, cirrhosis, allograft rejection or infection with human immune deficiency virus), also in the central nervous system (e.g. intraocular fibrosis) or nose (e.g. masal polyposis). The method can be used therapeutically or prophylactically.
                                                                                                                                                                                                                                                                               Somatostatin; agonist; inhibitor; fibrosis; kidney; lung; liver; skin; chemotherapy; glomerulonephritis; diabetes; cirrhosis; nasal polyposis; allograft rejection; infection; human immune deficiency virus; therapy; central nervous system; intraocular fibrosis.

Radiolabeling thiol-containing peptides with carefully formprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIR2-(CH2)m-X, or a fluorinated alkene in which at least one of the two double bonded a fluorinated alkene in which at least one of the two double bonded carbon atoms bears at least one leaving group comprising i. Br. Cl. azide, tosylate, mesylate, mesylate, i.m. m = 0-2; n+m = 0-2; x = I, Br. Cl, azide, tosylate, mesylate, nosylate, triflate, maleimide; X = I, Br. Cl, azide, tosylate, mesylate, nosylate, triflate, maleimide; CC (optionally substituted by CONH2, CONH2, CONH, OH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl. CC of quaternary ammonium, cOOR*, CONH2, COK, CH sulfonally substituted by CONH2, CONH2, CC (optionally substituted by CONH2, CONH2, CC (optionally substituted by CONH2, CONH2, OH, sulfonic acid, tertiary amine, or quaternary ammonium), COOR*, CONH2, COR*, and R* = 1-6C alkylor corquiting vectors such as proteins, antibodies, antibody fragments and receptor-targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0374-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to a method for incorporating 18F radionuclide into peptide-containing targeting vectors for use in clinical positron emission temporaphy. Radiolabeling thiol-containing peptides with comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F (CH2)m-CR1R2-(CH2)n-X, or a fluorinated alkene in which at least one of the two double bonded carbon across at least one leaving group comprising 1, Br. Cl. azide, tosylate, mesylate, nesylate, nesylate, ne m = 0-2; n+m = 0-2; x = 1, Br. Cl. azide, tosylate, mesylate, nosylate, rifilate, H, R2 = 1, Br. Cl. azide, tosylate, mesylate, nosylate, triflate, H, CONH2, COCH, OH, sulfonia caid, tertiary amine, quaternary ammonium, alkyl coptionally substituted by CONH2, COCH, OH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl corquaternary ammonium, alkyl coptionally substituted by CONH2, COCH, OH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl coptionally substituted by CONH2, COCH, OH, sulfonic acid, tertiary amine, quaternary ammonium, alkyl coptions as used for Radiolabeling peptide-containing creceptor-targeted peptides for was intibodies antibody fragments and receptor-targeted peptides for use in routine clinical positron emission tomography. The method is simple and efficient. The method uses the unique property of the free thiol groups which are rapidly alkylated at neutral pH and moderate temperature. Sequences AAY0374-716 represent examples of F-18 labeled peptides used in the method of detecting a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic peptide; bi-specific antibody; diagnosis; immune response; diseased tissue identification; therapy.

                                                                                         Synthetic
   conjugate that is capable of carrying at least I diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted to methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable

This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating a bi-specific diseased tissues in a patient comprishing administering a bi-specifically antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a H2 homologue of a prolyl tripoptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripoptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as ginglytics and periodontilis caused by

The sequences given in AAR34785 and AAR36780 represent proteins which participate in a yeast cell wall beta-glucan assembly pathway.

These proteins represent KREI and KRES respectively, and are essential for normal cell growth. KREI is a Ser/Thr rich protein probably probably probably probably through addition of O-linked mannose highly modified, probably through addition of O-linked mannose cesidues. Gene disruption of the KREI locus leads to a 40% reduced cesidues. Gene disruption of person of ABBS also caused defects in cell wall (1>6)-beta-glucan. Mutations at KRES also caused defects in cell wall (1>6)-beta-glucan production and appears to be defects in cell wall (1>6)-beta-glucan production and appears to be objected in which contains the COOH-terminal endoplasmic reticulum (ER) recention signal (His-Asp-Glu-Leu). Deletion of the KRES gene results in cells with aberant morphology and extremly compromised growth.

KREI and KRES are useful as tools for the in vitro screening of antifugal agents which inhibit fungi pathogenic to plants and animals.

The genes can be used to produce mutants for in vivo screening of antifungal agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              UGGT; UDP-glucose:glycoprotein glucosyltransferase; enzyme; KRE5.

into peptide-containing targeting vectors for use in clinical position into peptide-containing targeting vectors for use in clinical position comparably. Radiolabeling thiol-containing peptides with fluorine-18 (F-18) comprises reacting a peptide comprising a free thiol group with a labeling reagent of formula: 18F-(CH2)m-CRIRZ-(CH2)n-X, or a fluorinated alkene in which at least one of the two double bonded carbon atoms bears at least one leaving group comprising I, Br. CL, azide, tosylate, mosylate, nosylate, nosylate, in m = 0-2; n+m = 0-2; n
                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for incorporating 18F radionuclide
                                                                                                                                                                                                                                                                    Radiolabeling thiol-containing peptides with fluorine-18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Db
                                                                                                                                                                                                                                                                                                             The present invention relates to a method for determining the effect of a activity. The method comprises exposing an acceptor substrate for UGGT of a labelled donor in the presence of the test sample and UGGT. The method substrate for UGGT to is useful in glucosyltransferase assay and kinetics measurement for determining UGGT activity. In particular, the method is useful in glucosyltransferase assay and kinetics measurement for determining UGGT activity. UGGT is a soluble enzyme of the endoplasmic reticulum which catalyses the addition of a glucose residue onto reticulum clined oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence was used in a sequence homology comparison with rat UGGT (see AAF60732 and AAB72436) which was used in the method of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                         Determining the effect of a test sample on UDP-glucose:glycoprotein glucosyltransferase (UGGT), useful for measuring UGGT activity, comprises exposing an acceptor substrate for UGGT to a labeled donor in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18F radionuclide; targeting vector; positron emission tomography; F-18; radiolabeling; thiol; fluorine-18.

                                                                                                                        02-AUG-2001
        This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating or identifying diseased tissues in a patient comprising administering a bi-specific antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targetable conjugate. The methods and bi-specific antibodies and fusion proteins are useful for pre-targeting methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or annellorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthitis.

Confidous autoimmune diseases e.g. rheumatoid arthitis of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection, and many other of and sounders e.g. corneal infection, and many other disorders e.g. corneal infection, and many other of and wound healing and epithelial cell proliferation, to be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. The present sequence represents a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, antiarthritic, cardiant, monoclonal antibody; keloid, arthritis; Tumour Growth Factor-beta II receptor; TGF-beta II receptor; atopy; signal transduction inhibition; tissue fibrosis; atherosclerosis.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to grytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                       Nucleic acids encoding polypeptides with cytokine-like activities,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human monoclonal antibodies. The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of human TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such as tissue fibrosis in the lung, liver, skin, kidney or other tissues, atherosclerosis, atopy, keloid and arthritis. The present sequence was

sequences of anti-adipocyte monoconal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver farugs of trougs directly to the far mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells. By complement mediated lysis. The antibodies may be labeled with a clear complement mediated lysis. The antibodies may be labeled with a used in methods of diagnosis in human subjects e.g. to determine the presence of adipocytes of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for observing the types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-SEP-2001.
                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABB69676;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABB69676
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Db
         ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abernant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                         The polypeptide and polynucieotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity
